

EMPLOYMENT

LinkedIn | Sr. Software Engineer | Jan 2022 - Present

Member Observability Data Platform – LinkedIn

- **Unified Data Platform:** Built foundational components (Kafka event processing, dimension extraction, event throttling, event validation, metric extraction) to enable standardized, reusable, and high-performance real-time processing of member observability metrics.
- **Real-Time processing Migration:** Led crash reporting and site speed pipelines migration to the new platform reducing crash metric latency from 15 minutes to 1 minute and site speed processing from 1 day to 1 minute.
- **Real-Time Monitoring:** Operationalized metrics by building Grafana dashboards on top of MDM metric data store, reducing reporting delays and enabling engineers to debug production issues in near real time.

Crash Reporting - LinkedIn

- **Real-Time Crash Pipelines:** Real-time stream processing ~500M web/mobile error events daily, performing stacktrace unminification / symbolication with consistent error grouping to identify production bugs and avoid noise. Maintained high-throughput service exception pipelines with automated exception ticketing and dark canary validation for pre-production error detection.
- **Crash Metric Operationalization:** Crash metrics custom alerting, reduced time-to-detection to 30 minutes.
- **Experimentation platform integration:** Integrated crash metrics into experimentation platform (A/B testing) to power daily reports with crash metrics, and near realtime prevention of further ramps for buggy experiments/builds

Performance & Site Speed Monitoring – LinkedIn

- **Scalable Performance Analytics:** Built Spark pipelines processing ~10 TB/day of telemetry across 10+ workflows, enabling global site speed monitoring for 400–500 engineers.
- **Regression Detection & Alerting:** Designed automated sitespeed regression detection system, shifting from manual discovery to guaranteed detection—catching backend, network, and page load slowdowns in core features.
- **Experiment Impact Reporting:** Integrated performance metrics into A/B testing, making regressions a blocker for ramps; adopted across client experiments, preventing ~200 regressions in 6 months.
- **Automation & Toil Reduction:** Automated Spark job monitoring, backfill handling, and regression ticket resolution—reducing pipeline interventions by **90%** and eliminating manual regression ticket handling entirely.
- **Cross-Team Collaboration:** Partnered with the Abuse team to detect and filter bot/scraper traffic, cutting false positive regressions and ensuring high signal-to-noise in performance alert

TIBCO | Software Engineer | July 2018 - Jan 2021

- Developed Data connectors for iPaaS platform - Flogo (No code integration)
- Microservice development for SQL auto-complete, query compose and validation.
- Developed containerized Flogo connectors automation framework

SKILLS

- **Programming Languages:** Python, Java, Golang, JavaScript, Scala
- **Data Processing & Streaming:** Apache Flink, Apache Beam, Apache Spark, Kafka, Samza, Stream Processing, Offline Data Processing, Big Data Analytics
- **Databases & Storage:** PostgreSQL, MySQL, MongoDB, Redis, Apache Pinot (OLAP), HDFS, Kusto, MDM
- **Tools and Technologies:** AWS, Docker, CI/CD, Grafana, OpenTelemetry, Crash Analytics, A/B Testing

EDUCATION

San Jose State University | MS Computer Software Engineering | Aug 2020 - May 2022

- **Coursework:** Software Security, Big Data Engg, Systems Engg, Software Overview, Distributed Systems, Ent. Application Development, Data Mining, Advanced Parallel Systems

ACADEMIC PROJECTS

- **BitCorner** [*Apr 21 - May 21*] Bitcoin exchange platform, to buy / sell BitCorner (bitcoins) with market / limit prices. Developed the fair order execution algorithm and bill payments with currency exchanges. Java-SpringBoot backend, React - Redux frontend, PostgreSQL as db, JPA as ORM, Microservices deployment to AWS
- **eDiligence** [*Aug 20 - Dec 20*] Designed and Developed containerized backend Infrastructure from scratch, optimized for deployment costs. Implemented Microservices architecture for Golang backend services and an nGinx API gateway. Faster releases with continuous integration pipelines (GitActions), integrated with validation test framework. Golang, Nginx, Docker-compose, Postgres, DigitalOcean, Microservices, CI-CD, git Actions
- **Reddit** and **SplitWise** Web application clones.

ADDITIONAL AWARDS

- LinkedIn - Top bounty for "Time Saver"
- Scholarship for 4 year Engg Program
